

Assignment ASP.NET MVC

We have an auction system website in which users place bids within individual auctions.

Task 1

In the AuctionController class we have the Detail method. In this method, the maximum bids of individual users are loaded into the list from the AuctionRepository. The user bid is stored in an instance of the Bid class. Implement a list of these bids in the form of an HTML table in the Detail.cshtml file or as API with JSON response.

Aukcia 1
